

## Cleaning Needles Set

**Item No.: 361361713**

### Product information

To ensure good performance and work quality, regular maintenance of welding fixing and cutting nozzles with cleaning needles is recommended. Clogged nozzles with carbon deposits or slag may lead to backfire (popping sound).

When you clean the nozzle holes with the needles, they should run freely inside. Don't twist them, just stick them in and pull them out.

steel wire, wedges or twist drills for cleaning can damage the smooth surfaces of the hole so they should not be used. It is very important that the small holes in the sealing end of the cutting nozzles are not enlarged in any way. with a soft brass brush, the welding parts and nozzles can be carefully cleaned externally. Do not use a steel brush.
